## Overview

Are bromine-based flow batteries suitable for stationary energy storage?

Bromine-based flow batteries (Br-FBs) have been widely used for stationary energy storage benefiting from their high positive potential, high solubility and low cost. However, they are still confronted with serious challenges including bromine cross-diffusion, sluggish reaction kinetics of  $\text{Br}_2/\text{Br}^-$  redox couple and sometimes dendrites.

Are zinc-bromine flow batteries a transformative energy storage technology?

Abstract Zinc-bromine flow batteries (ZBFBs) have received widespread attention as a transformative energy storage technology with a high theoretical energy density ( $430 \text{ Wh kg}^{-1}$ ). However, its effi.

Can a zinc bromine static battery control self-discharge?

Gao et al. demonstrated a zinc bromine static battery with a glass fibre membrane as the separator to control the self-discharge and improve the energy efficiency (Figure 10). This static battery was achieved by using tetrapropylammonium bromide (TPABr) as the complexing agent.

Does bromine cross-diffusion affect battery life?

The easy bromine cross-diffusion causes serious self-discharge, leading to low coulombic efficiency (CE), high capacity decay rate and short lifespan [6, 33, 43]. In addition, for metal-based hybrid Br-FBs, the metal accumulation/dendrite issue during the charge process affects the battery life and reliability [28, 44, 45].
