## Overview

---

How much energy does a refrigerated warehouse use?

For cooling expenditures, the typical refrigerated warehouse uses about 25 kWh of electricity per square foot per year. High energy usage in cold storage can be explained by thermodynamic principles. Heat naturally travels from hot spots to cold spots due to diffusion.

Do cold storage rooms use a lot of energy?

Cold storage rooms consume considerable amounts of energy. Within cold storage facilities 60-70% of the electrical energy may be used for refrigeration. Therefore cold store users have considerable incentive to reduce energy consumption. The performance of a large number of cold stores has never been compared in detail across a range of locations.

How much energy does a cold store use?

**INTRODUCTION** Almost all chilled and frozen food is stored in a cold store at some stage throughout the food cold chain. Cold storage rooms consume considerable amounts of energy. Asano & Mugabi (2013) stated that within cold storage facilities, 60–70% of the electrical energy may be used for refrigeration.

Why do food & refrigeration industries use a lot of electricity?

This process involves a consistent flow of electrical energy to maintain a temperature disequilibrium, which is essential for keeping the stored products cool. This continuous power consumption is the primary reason for the high electricity costs associated with the food and refrigeration industries.
