## Overview

What is electric double layer capacitor (EDLC)?

Electric double layer capacitor (EDLC) [1, 2] is the electric energy storage system based on charge-discharge process (electrosorption) in an electric double layer on porous electrodes, which are used as memory back-up devices because of their high cycle efficiencies and their long life-cycles. A schematic illustration of EDLC is shown in Fig. 1.

Why does a double-layer capacitor have a large electric capacity?

Unlike a normal capacitor, a double-layer capacitor has a large electric capacity because the electric double-layer, that is a layer with the opposite polarity to the electrode is formed around the electrode of the electrolyte. As with normal capacitors, it has very good high-current charge/discharge and repetitive cycle characteristics.

How do electric double-layer capacitors store electric charge?

Electric double-layer capacitors (EDLC/supercapacitors) store electric charge by absorbing ions on the surface of activated carbon electrodes immersed in an electrolytic solution to form an electric double layer.

What is the capacitance mechanism of electric double layer capacitors?

Binoy K. Saikia The capacitance mechanism of Electric Double Layer Capacitors is similar to that of dielectric capacitors. In conventional capacitors, energy is stored by the accumulation of charges on two parallel metal electrodes which separated by dielectric medium with a potential difference between them.
