Overview

What is a building energy management system (BEMS)?

A Building Energy Management System (BEMS) is a set of software and hardware tools that help organizations monitor, control, and optimize energy consumption in buildings. BEMS can monitor and control various building systems such as heating, ventilation, air conditioning (HVAC), lighting, and other energy-consuming equipment.

What is a rule-based energy management system?

A rule-based energy management system focuses on designing and implementing the logic governing energy distribution among connected DERs. It relies on established rules and predefined guidelines to make real-time decisions about energy allocation.

What is an energy management system?

An energy management system is the building block of future energy use cases as it intelligently monitors and controls a variety of energy assets within a household, building or larger site. Gateway: a data collection and processing system that ideally operates independently of manufacturers.

What is a forecast-based energy management system?

A forecast-based energy management system, on the other hand, specializes in crafting advanced optimization strategies for complex energy management scenarios that rule-based EMS cannot address. This system aims to enhance profitability, computational efficiency, and security in a changing energy landscape.
