Power station generator set composition

Overview

What components make up a generator set?

The various components that make up the generator set will be described below. Common generator sets in Australia generally use gasoline, diesel or liquefied petroleum gas, and there are also some steam engines, and biodiesel engines are also expected to be popular in the future.

What is the rated power of a generator set?

The rated power of the generator set is the apparent power, which is usually based on the output under the condition that the power factor is 0.8. The power factor of 0.8 is the power factor of general loads in most occasions, but in fact there are many loads whose power factor is not 0.8.

What is a generator & how does it work?

Generators are equipment designed to generate electrical power. They can therefore be key elements in the event of a mains failure, guaranteeing power to the facility they serve, or to operate continuously, ensuring the total supply of electricity to various types of applications and projects.

What kind of engine does a generator use in Australia?

Common generator sets in Australia generally use gasoline, diesel or liquefied petroleum gas, and there are also some steam engines, and biodiesel engines are also expected to be popular in the future. The prime mover rotates the generator to generate electricity, therefore, the prime mover must meet the alternator's rated power.
