

S in solar inverter

Overview

How does a solar inverter work?

Most homes and appliances run on alternating current (AC). This is where the solar inverter comes in. Put simply, a solar inverter converts the DC electricity generated by your solar panels into AC electricity that can be used in your household or fed back into the power grid. Without it, all that solar energy would be essentially unusable.

What is a solar inverter?

Solar Inverter – Definition: Every PV system requires at least one inverter. While the utility grid supplies alternating current (AC) and most domestic appliances and machines also run on alternating current, the PV modules on your roof generate direct current (DC). So, this first has to be converted into alternating current (AC) for everyday use.

How do I choose a solar inverter?

The size of your solar and inverter setup should align closely with the power output of your solar panels. The efficiency rating indicates how well an inverter converts solar energy into usable electricity. Look for inverters with high efficiency ratings, typically above 95%, to ensure you're getting the most out of your solar panels.

Why do you need a solar inverter?

And in the case of hybrid or off-grid systems, solar inverters manage the flow of energy between your solar panels, battery storage, and household loads. In essence, they ensure balance. They optimize performance. They keep your energy reliable, even when the sun isn't shining at full strength.
