

The latest design standards for hybrid energy sources for ground-to-air solar container communication stations

Overview

What makes a good hybrid system design?

A good optimal hybrid system design should meet all the load requirements which should also lead to the minimisation of the overall system cost (Bhandari et al. 2014). Therefore, reducing emissions, overall system cost, excess electricity production, and unmet load are critically considered in sizing renewable energy components.

What is a hybrid solar energy system?

This hybrid system can take advantage of the complementary nature of solar and wind energy: solar panels produce more electricity during sunny days when the wind might not be blowing, and wind turbines can generate electricity at night or during cloudy days when solar panels are less effective.

How can a hybrid energy system be integrated?

Setting clear renewable energy targets and mandates, establishing grid interconnection standards, and designing market structures and regulatory frameworks that facilitate the integration of hybrid systems are paramount.

Is a standalone wind / solar/diesel generator hybrid system viable?

Salisu et al. (2019) studied the viability of a standalone Wind /Solar/Diesel generator hybrid system using HOMER Pro soft-ware. Cost of energy (COE), net present cost (NPC), renewable fraction (RF), greenhouse gas emission (GHG), and cost of operation as presented is \$0.110/kWh, 98.3%, \$1.01m, 2889.36kg/ year and \$ 4723, respectively.
