Overview

How are fuel and electricity combined in a reefer container?

Fuel and electricity are combined because the reefer container is transported on different ways. During transport overseas, on container vessels, the genset is usually powered by the ship's electrical power. When the generator set is used on a cargo truck, it's usually powered by diesel because there is no electrical power supply available.

Can a reefer container plug into an external power grid?

When a reefer container is stationary at a port or facility, it can plug into an external power grid to maintain its internal temperature. However, during transit, access to external power sources is not feasible. In these situations, gensets become the primary power source.

What is a genset container?

They are more permanently attached compared to clip-on Gensets and are typically used when the container is expected to remain on the same transport method for a longer period, such as an extended trucking journey.

Do reefer containers need a generator set?

A reefer container does not cool itself and therefore a generator set is necessary, to provide it with electricity all over the world. These containers are used for international transport (or storage) and often contain goods like medicines that must remain at a certain temperature. How does a container genset work?
